# Characteristic Functions

Po-Ning Chen, Professor

Institute of Communications Engineering

National Chiao Tung University

Hsin Chu, Taiwan 300, R.O.C.

## Characteristic function

26-1

**Definition (characteristic function)** The *characteristic function* of a random variable  $X$  is defined for real  $t$  by:

$$\varphi(t) = \int_{-\infty}^{\infty} e^{itx} dF_X(x) = \int_{-\infty}^{\infty} \cos(tx) dF_X(x) + i \int_{-\infty}^{\infty} \sin(tx) dF_X(x).$$

- The characteristic function  $\varphi(t) = M(it)$ , where  $M(t)$  is the moment generating function of random variable  $X$ .
- The characteristic function is the (inverse) Fourier transform of distribution function.
- The characteristic function always exist, because distribution function is always integrable.
- It is named the *characteristic function* since it completely *characterizes* the distribution.

## Fundamental properties regarding characteristic functions<sup>S26-2</sup>

### **Fundamental properties of characteristic functions**

- The characteristic function of sum of two independent random variables is the product of individual characteristic functions.
- The characteristic function *uniquely* determines distribution function.
- From *the pointwise convergence* of characteristic function follows the *in-distribution convergence* of random variables.

## Moments and characteristic function

26-3

- $\varphi(0) = 1$ .
- $|\varphi(t)| \leq 1$  for all  $t \in \mathfrak{R}$ .
- $\varphi(t)$  is *uniformly continuous*.

**Definition (uniform continuity)** A function  $f(t)$  is *uniformly continuous* in  $\mathcal{A}$ , if for any  $\delta > 0$ , there exists  $h > 0$  such that

$$\sup_{\{(x,y) \in \mathcal{A}^2 : |x-y| \leq h\}} |f(x) - f(y)| < \delta.$$

## Moments and characteristic function

26-4

*Proof:*

$$\begin{aligned} |\varphi(t+h) - \varphi(t)| &= \left| \int_{-\infty}^{\infty} e^{i(t+h)x} dF_X(x) - \int_{-\infty}^{\infty} e^{itx} dF_X(x) \right| \\ &= \left| \int_{-\infty}^{\infty} (e^{ihx} - 1) e^{itx} dF_X(x) \right| \\ &\leq \int_{-\infty}^{\infty} |e^{ihx} - 1| \cdot |e^{itx}| dF_X(x) \\ &= \int_{-\infty}^{\infty} |e^{ihx} - 1| dF_X(x), \\ &\left( = \int_{-\infty}^{\infty} \sqrt{(\cos(hx) - 1)^2 + \sin^2(hx)} dF_X(x) \right. \\ &= \int_{-\infty}^{\infty} \sqrt{2 - 2\cos(hx)} dF_X(x) \\ &= \int_{-\infty}^{\infty} 2 |\sin(hx/2)| dF_X(x) \\ &= \left. 2E [|\sin(hX/2)|] \right) \end{aligned}$$

where the bound is independent of  $t$ .

□.

## Taylor expansion for characteristic functions

26-5

**Theorem (Taylor's formula with remainder)** Assume that  $f(\cdot)$  has a continuous derivative of order  $n + 1$  in some open interval containing  $a$ . Then

$$f(x) = \sum_{k=0}^n \frac{f^{(k)}(a)}{k!} (x - a)^k + \frac{1}{n!} \int_a^x (x - t)^n f^{(n+1)}(t) dt.$$

By the Taylor's formula with remainder about  $x = 0$ ,

$$\begin{aligned} e^{ix} &= \sum_{k=0}^n \frac{(e^{ix})^{(k)}|_{x=0}}{k!} x^k + \frac{1}{n!} \int_0^x (x - t)^n (e^{it})^{(n+1)} dt \\ &= \sum_{k=0}^n \frac{i^k}{k!} x^k + \frac{1}{n!} \int_0^x (x - t)^n (i^{n+1} e^{it}) dt \\ &= \sum_{k=0}^n \frac{(ix)^k}{k!} + \frac{i^{n+1}}{n!} \int_0^x (x - t)^n e^{it} dt. \end{aligned}$$

## Taylor expansion for characteristic functions

26-6

Integration by part for the below expression yields that:

$$\begin{aligned}\int_0^x (x-t)^{n-1} e^{it} dt &= -\frac{(x-t)^n}{n} e^{it} \Big|_0^x + \int_0^x \frac{(x-t)^n}{n} (ie^{it}) dt \\ &= \frac{x^n}{n} + \frac{i}{n} \int_0^x (x-t)^n e^{it} dt \\ &= \int_0^x (x-t)^{n-1} dt + \frac{i}{n} \int_0^x (x-t)^n e^{it} dt,\end{aligned}$$

which implies that:

$$\int_0^x (x-t)^{n-1} (e^{it} - 1) dt = \frac{i}{n} \int_0^x (x-t)^n e^{it} dt,$$

This summarizes to:

$$e^{ix} - \sum_{k=0}^n \frac{(ix)^k}{k!} = \begin{cases} \frac{i^{n+1}}{n!} \int_0^x (x-t)^n e^{it} dt \\ \frac{i^n}{(n-1)!} \int_0^x (x-t)^{n-1} (e^{it} - 1) dt \end{cases}$$

# Taylor expansion for characteristic functions

Therefore, for  $x \geq 0$ ,

$$\begin{aligned}
 \left| e^{ix} - \sum_{k=0}^n \frac{(ix)^k}{k!} \right| &= \begin{cases} \left| \frac{i^{n+1}}{n!} \int_0^x (x-t)^n e^{it} dt \right| \\ \left| \frac{i^n}{(n-1)!} \int_0^x (x-t)^{n-1} (e^{it} - 1) dt \right| \end{cases} \\
 &\leq \begin{cases} \frac{1}{n!} \int_0^x |(x-t)^n| \cdot |e^{it}| dt \\ \frac{1}{(n-1)!} \int_0^x |(x-t)^{n-1}| \cdot |(e^{it} - 1)| dt \end{cases} \\
 &\leq \begin{cases} \frac{1}{n!} \int_0^x (x-t)^n dt \\ \frac{2}{(n-1)!} \int_0^x (x-t)^{n-1} dt \end{cases}, \text{ (since } |e^{it} - 1| \leq |e^{it}| + 1 = 2) \\
 &= \begin{cases} \frac{x^{n+1}}{(n+1)!} \\ \frac{2x^n}{n!} \end{cases}
 \end{aligned}$$

# Taylor expansion for characteristic functions

and for  $x < 0$ ,

$$\begin{aligned}
 \left| e^{ix} - \sum_{k=0}^n \frac{(ix)^k}{k!} \right| &= \begin{cases} \left| \frac{i^{n+1}}{n!} \int_0^x (x-t)^n e^{it} dt \right| \\ \left| \frac{i^n}{(n-1)!} \int_0^x (x-t)^{n-1} (e^{it} - 1) dt \right| \end{cases} \\
 &\leq \begin{cases} \frac{1}{n!} \int_x^0 |(x-t)^n| \cdot |e^{it}| dt \\ \frac{1}{(n-1)!} \int_x^0 |(x-t)^{n-1}| \cdot |(e^{it} - 1)| dt \end{cases} \\
 &\leq \begin{cases} \frac{1}{n!} \int_x^0 (t-x)^n dt \\ \frac{2}{(n-1)!} \int_x^0 (t-x)^{n-1} dt \end{cases}, \text{ (since } |e^{it} - 1| \leq |e^{it}| + 1 = 2) \\
 &= \begin{cases} \frac{(-x)^{n+1}}{(n+1)!} \\ \frac{2(-x)^n}{n!} \end{cases}
 \end{aligned}$$

## Taylor expansion for characteristic functions

26-9

So to speak,

$$\left| e^{ix} - \sum_{k=0}^n \frac{(ix)^k}{k!} \right| \leq \min \left\{ \frac{|x|^{n+1}}{(n+1)!}, \frac{2|x|^n}{n!} \right\}.$$

**Lemma** If  $X$  has a moment of order  $n$ , then

$$\left| \varphi(t) - \sum_{k=0}^n \frac{(it)^k}{k!} E[X^k] \right| \leq E \left[ \min \left\{ \frac{|tX|^{n+1}}{(n+1)!}, \frac{2|tX|^n}{n!} \right\} \right]$$

(if the moment of order  $(n+1)$  also exists)  $\leq \min \left\{ \frac{|t|^{n+1} E[|X|^{n+1}]}{(n+1)!}, \frac{2|t|^n E[|X|^n]}{n!} \right\}.$

**Proof:**

$$\begin{aligned} \left| \varphi(t) - \sum_{k=0}^n \frac{(it)^k}{k!} E[X^k] \right| &= \left| \int_{\mathfrak{R}} e^{itx} dF_X(x) - \sum_{k=0}^n \frac{(it)^k}{k!} \int_{\mathfrak{R}} x^k dF_X(x) \right| \\ &\leq \int_{\mathfrak{R}} \left| e^{itx} - \sum_{k=0}^n \frac{(itx)^k}{k!} \right| dF_X(x). \end{aligned}$$

□

## Taylor expansion for characteristic functions

26-10

- **Concern:** When does the characteristic function have Taylor expansion?

**Corollary** If for any  $t$ ,

$$\lim_{n \rightarrow \infty} \frac{|t|^n E[|X|^n]}{n!} = 0,$$

then

$$\varphi(t) = \sum_{k=0}^{\infty} \frac{(it)^k}{k!} E[X^k].$$

**Theorem** If

$$E[e^{t|X|}] = \sum_{k=0}^{\infty} \frac{|t|^k}{k!} E[|X|^k] < \infty,$$

then

$$\varphi(t) = \sum_{k=0}^{\infty} \frac{(it)^k}{k!} E[X^k].$$

## Taylor expansion for characteristic functions

26-11

**Corollary** If for some  $t_0 \neq 0$ ,

$$\varphi(t_0) = \sum_{k=0}^{\infty} \frac{(it_0)^k}{k!} E[X^k],$$

then

1. for every  $-|t_0| \leq t \leq |t_0|$ ,

$$\varphi(t) = \sum_{k=0}^{\infty} \frac{(it)^k}{k!} E[X^k].$$

2.  $\varphi^{(k)}(0) = i^k E[X^k]$  for every  $k = 0, 1, 2, \dots$

- Property 2, as a direct consequence of Property 1, is seemingly an analogous property to the moment generating function.
- However, moments can be determined by the characteristic function in a much weaker sense! (Notably, unlike the moment generation function which may have a big jump at the origin, the characteristic function is always uniformly continuous.)

# Taylor expansion for characteristic functions

26-12

**Lemma** If  $E[|X^k|] < \infty$ , then

$$\varphi^{(k)}(0) = i^k E[X^k].$$

**Proof:**

1.  $k = 1$ :

$$\begin{aligned} \left| \frac{\varphi(t+h) - \varphi(t)}{h} - E[iXe^{itX}] \right| &= \left| E \left[ \frac{1}{h} e^{i(t+h)X} - \frac{1}{h} e^{itX} - iXe^{itX} \right] \right| \\ &= \left| E \left[ e^{itX} \frac{(e^{ihX} - 1 - ihX)}{h} \right] \right| \\ &\leq E \left[ |e^{itX}| \cdot \left| \frac{e^{ihX} - 1 - ihX}{h} \right| \right] \\ &\leq E \left[ \frac{\min\{(1/2)|hX|^2, 2|hX|\}}{h} \right] \\ &= E \left[ \min\{(1/2)h|X|^2, 2|X|\} \right]. \end{aligned}$$

By bounded convergence theorem,  $\min\{(1/2)h|X|^2, 2|X|\} \leq 2|X|$ , where  $|X|$  is integrable, and  $\lim_{h \downarrow 0} \min\{(1/2)h|x|^2, 2|x|\} = 0$  almost everywhere jointly imply

$$\lim_{h \downarrow 0} E \left[ \min\{(1/2)h|X|^2, 2|X|\} \right] = 0.$$

## Taylor expansion for characteristic functions

26-13

**Theorem (bounded convergence theorem)** If (i)  $|f_n| \leq g$  almost everywhere, (ii)  $g$  is integrable, and (iii)  $f_n \rightarrow f$  almost everywhere, then  $f$  is integrable and  $\int f_n d\mu = \int f d\mu$ .

Hence, we obtain:

$$\varphi'(t) = \lim_{h \downarrow 0} \frac{\varphi(t+h) - \varphi(t)}{h} = E[(iX)e^{itX}],$$

and

$$\varphi'(0) = E[iX].$$

**2.  $k = 2$ :**

$$\begin{aligned}
 \left| \frac{\varphi'(t+h) - \varphi'(t)}{h} - E[(iX)^2 e^{itX}] \right| &= \left| \frac{E[(iX)e^{i(t+h)X}] - E[(iX)e^{itX}]}{h} - E[(iX)^2 e^{itX}] \right| \\
 &= \left| E \left[ (iX)e^{itX} \frac{e^{ihX} - 1 - ihX}{h} \right] \right| \\
 &\leq E \left[ |X| \cdot |e^{itX}| \cdot \left| \frac{e^{ihX} - 1 - ihX}{h} \right| \right] \\
 &\leq E \left[ \min\{(1/2)h|X|^3, 2|X|^2\} \right],
 \end{aligned}$$

which again gives by bounded convergence theorem that

$$\varphi^{(2)}(t) = E[(iX)^2 e^{itX}],$$

and

$$\varphi^{(2)}(0) = E[(iX)^2].$$

**3. Induction:** The lemma can be proved by repeating the above process by induction (proving that the lemma holds for  $k = n + 1$  under the premise that the lemma is valid for  $k = n$ ). □

## Taylor expansion for characteristic functions

26-15

- The above lemma does not imply that the derivatives of  $\varphi(t)$  always exist. On the contrary,  $\varphi(t)$  may be non-differentiable even if it is uniformly continuous.
- The above lemma actually tells us that the more moments  $X$  has, the more derivatives  $\varphi$  has.
- **Brainstorming:** Can this property be applied to Fourier Transform pair? Certainly, if the function is integrable.
- **Brainstorming:** In concept, the **tail** (rate-of-decaying) behavior of the distribution determines the **smoothness** (order of differentiability) of  $\varphi$ .

# Riemann-Lebesgue theorem

26-16

**Theorem 26.1 (Riemann-Lebesgue theorem)** If  $X$  has a density, then  $\varphi_X(t) \xrightarrow{|t| \rightarrow \infty} 0$ .

Every Lebesgue integrable function can be approximated by Riemann integrable functions of two kinds.

**Theorem 17.1** Suppose that  $\int_{\mathbb{R}} |f(x)| dx < \infty$  (which indicates its Lebesgue integrability) and  $\varepsilon > 0$  fixed.

1. There exists a step function  $g(x) = \sum_{i=1}^k x_i I_{(a_i, b_i]}(x)$  (which indicates its Riemann integrability), where each  $a_i$  and  $b_i$  are finite real numbers, such that

$$\int_{\mathbb{R}} |f(x) - g(x)| dx < \varepsilon.$$

2. There exists a continuous integrable  $h$  with bounded support (namely, which indicates its Riemann integrability) such that

$$\int_{\mathbb{R}} |f(x) - h(x)| dx < \varepsilon.$$

*Notably, a bounded measurable function is Riemann integrable on  $[a, b]$  if it is continuous in  $[a, b]$ .*

## Riemann-Lebesgue theorem

26-17

**Proof:** From Theorem 17.1, there is a step function  $g(x) = \sum_{j=1}^k x_j I_{(a_j, b_j]}(x)$  such that

$$\int_{\mathfrak{R}} |f(x) - g(x)| dx < \varepsilon,$$

where  $f(x)$  is the density of  $X$ , and satisfies  $\int_{\mathfrak{R}} f(x) dx = 1 < \infty$ . Therefore,

$$\begin{aligned} \left| \int_{\mathfrak{R}} f(x) e^{itx} dx - \int_{\mathfrak{R}} g(x) e^{itx} dx \right| &= \left| \int_{\mathfrak{R}} (f(x) - g(x)) e^{itx} dx \right| \\ &\leq \int_{\mathfrak{R}} |f(x) - g(x)| dx < \varepsilon. \end{aligned}$$

The proof is completed by noting that  $\varepsilon$  is arbitrary and

$$\begin{aligned} \int_{\mathfrak{R}} g(x) e^{itx} dx &= \int_{\mathfrak{R}} \left( \sum_{j=1}^k x_j I_{(a_j, b_j]}(x) \right) e^{itx} dx \\ &= \sum_{j=1}^k x_j \int_{a_j}^{b_j} e^{itx} dx \\ &= \sum_{j=1}^k x_j \left( \frac{e^{itb_j} - e^{ita_j}}{it} \right) \xrightarrow{|t| \rightarrow \infty} 0. \end{aligned}$$

□

## Independent and Inversion

26-18

- The characteristic function of sum of independent random variables is the product of individual characteristic functions.
- The characteristic function of  $-X$  is the complex conjugate of the characteristic function of  $X$ .

## Inversion and uniqueness theorem

26-19

- How to prove that “The characteristic function uniquely determines the probability distribution.”
- This is the task of **Uniqueness Theorem**.
- **Please again think of the counterpart theorem for Fourier transformation.**
- Also, remember that the cdf of a random variable is sufficient to define its statistic properties.

## Inversion and uniqueness theorem

26-20

**Example 18.4** Prove  $S(T) = \int_0^T \frac{\sin(x)}{x} dx \xrightarrow{T \rightarrow \infty} \frac{\pi}{2}$ .

*Proof:*

$$\begin{aligned} \int_0^T \frac{\sin(x)}{x} dx &= \int_0^T \sin(x) \left[ \int_0^\infty e^{-ux} du \right] dx \\ &= \int_0^\infty \left[ \int_0^T e^{-ux} \sin(x) dx \right] du \quad (\text{By Fubini's theorem}) \\ &= \int_0^\infty \frac{1}{1+u^2} [1 - e^{-uT} (u \sin(T) + \cos(T))] du \\ &= \int_0^\infty \frac{1}{1+u^2} du - \int_0^\infty \frac{e^{-uT}}{1+u^2} (u \sin(T) + \cos(T)) du \\ &= \tan^{-1}(u) \Big|_0^\infty - \int_0^\infty \frac{e^{-uT}}{\sqrt{1+u^2}} \cos(T - \phi_u) du, \text{ where } \cos(\phi_u) = 1/\sqrt{1+u^2} \\ &= \frac{\pi}{2} - \int_0^\infty \frac{e^{-uT}}{\sqrt{1+u^2}} \cos(T - \phi_u) du. \end{aligned}$$

## Inversion and uniqueness theorem

26-21

Finally,

$$\begin{aligned} \left| \int_0^\infty \frac{e^{-uT}}{\sqrt{1+u^2}} \cos(T - \phi_u) du \right| &\leq \int_0^\infty e^{-uT} \frac{1}{\sqrt{1+u^2}} |\cos(T - \phi_u)| du \\ &\leq \int_0^\infty e^{-uT} du, \text{ because } 1 \geq \frac{1}{\sqrt{1+u^2}} \text{ for } u \geq 0 \\ &= \frac{1}{T} \xrightarrow{T \rightarrow \infty} 0. \end{aligned}$$

□

**Theorem (Fubini's theorem)** Suppose  $\mathcal{X}$  and  $\mathcal{Y}$  can be expressed as  $\mathcal{X} = \cup_{i=1}^\infty \mathcal{U}_i$  and  $\mathcal{Y} = \cup_{i=1}^\infty \mathcal{V}_i$  for some  $\{\mathcal{U}_i\}_{i=1}^\infty$  and  $\{\mathcal{V}_i\}_{i=1}^\infty$  with  $\mu(\mathcal{U}_i) < \infty$  and  $\nu(\mathcal{V}_i) < \infty$ . Then, if either

$$\int_{\mathcal{X}} \left( \int_{\mathcal{Y}} |f(x, y)| \nu(dy) \right) \mu(dx) < \infty$$

or

$$\int_{\mathcal{Y}} \left( \int_{\mathcal{X}} |f(x, y)| \mu(dx) \right) \nu(dy) < \infty,$$

$$\int_{\mathcal{X}} \left( \int_{\mathcal{Y}} f(x, y) \nu(dy) \right) \mu(dx) = \int_{\mathcal{Y}} \left( \int_{\mathcal{X}} f(x, y) \mu(dx) \right) \nu(dy).$$

## Inversion and uniqueness theorem

26-22

Checking:

$$\int_0^T \int_0^\infty |\sin(x)e^{-ux}| du dx = \int_0^T \frac{|\sin(x)|}{x} dx \leq T < \infty.$$

# Inversion and uniqueness theorem

26-23

Indeed,  $0 \leq S(T) \leq S(\pi)$ .

# Inversion and uniqueness theorem

26-24

## Observation

$$\int_{-T}^T \frac{e^{itx}}{it} dt = 2 \operatorname{sgn}(x) S(T|x|), \text{ where } \operatorname{sgn}(x) = \begin{cases} 1, & \text{if } x > 0; \\ 0, & \text{if } x = 0; \\ -1, & \text{if } x < 0. \end{cases}$$

## Proof:

$$\begin{aligned} \int_{-T}^T \frac{e^{itx}}{it} dt &= \int_{-T}^0 \frac{e^{itx}}{it} dt + \int_0^T \frac{e^{itx}}{it} dt \\ &= \int_0^T \frac{-e^{-itx}}{it} dt + \int_0^T \frac{e^{itx}}{it} dt \\ &= \int_0^T \frac{e^{itx} - e^{-itx}}{it} dt = 2 \int_0^T \frac{\sin(tx)}{t} dt \\ &= 2 \operatorname{sgn}(x) \int_0^T \frac{\sin(t|x|)}{t} dt, \\ &= 2 \operatorname{sgn}(x) \int_0^{T|x|} \frac{\sin(t')}{t'} dt' = 2 \operatorname{sgn}(x) S(T|x|). \end{aligned}$$

□

- Actually, when  $x = 0$ , a rigorous statement should be  $\int_{-T}^T \frac{1}{it} dt = \text{indeterminable}$ .

## Inversion and uniqueness theorem

26-25

**Theorem 26.2 (Uniqueness theorem)** For any  $a$  and  $b$  with  $\Pr[X = a] = \Pr[X = b] = 0$  and  $a < b$ ,

$$\Pr[a < X \leq b] = \lim_{T \rightarrow \infty} \frac{1}{2\pi} \int_{-T}^T \frac{e^{-ita} - e^{-itb}}{it} \varphi_X(t) dt,$$

where  $\varphi_X(t)$  is the characteristic function of random variable  $X$ .

**Proof:**

- Let  $I_T$  denote the quantity inside the limit, namely,

$$\begin{aligned} I_T &= \frac{1}{2\pi} \int_{-T}^T \frac{e^{-ita} - e^{-itb}}{it} \varphi_X(t) dt \\ &= \frac{1}{2\pi} \int_{-T}^T \frac{e^{-ita} - e^{-itb}}{it} \left( \int_{-\infty}^{\infty} e^{itx} dF_X(x) \right) dt \\ &= \frac{1}{2\pi} \int_{-\infty}^{\infty} \left( \int_{-T}^T \frac{e^{it(x-a)} - e^{it(x-b)}}{it} dt \right) dF_X(x) \\ &= \frac{1}{\pi} \int_{-\infty}^{\infty} [\operatorname{sgn}(x-a)S(T|x-a|) - \operatorname{sgn}(x-b)S(T|x-b|)] dF_X(x). \end{aligned}$$

- The absolute value of the above integrand, namely  $[\operatorname{sgn}(x-a)S(T|x-a|) - \operatorname{sgn}(x-b)S(T|x-b|)]$ , is bounded above by  $2S(\pi)$ , which is integrable with

## Inversion and uniqueness theorem

26-26

respect to measure  $dF_X(x)$ .

Hence, by bounded convergence theorem,

$$\begin{aligned}\lim_{T \rightarrow \infty} I_T &= \frac{1}{\pi} \int_{-\infty}^{\infty} \lim_{T \rightarrow \infty} [\operatorname{sgn}(x-a)S(T|x-a|) - \operatorname{sgn}(x-b)S(T|x-b|)] dF_X(x) \\ &= \frac{1}{\pi} \int_{-\infty}^{\infty} \psi_{a,b}(x) dF_X(x),\end{aligned}$$

## Inversion and uniqueness theorem

26-27

where

$$\begin{aligned} \psi_{a,b}(x) &= \lim_{T \rightarrow \infty} [\operatorname{sgn}(x-a)S(T|x-a|) - \operatorname{sgn}(x-b)S(T|x-b|)] \\ &= \lim_{T \rightarrow \infty} \begin{cases} S(T|x-b|) - S(T|x-a|), & \text{for } x < a; \\ S(T|x-b|), & \text{for } x = a; \text{ indeterminable!} \\ S(T|x-a|) + S(T|x-b|), & \text{for } a < x < b; \\ S(T|x-a|), & \text{for } x = b; \text{ indeterminable!} \\ S(T|x-a|) - S(T|x-b|), & \text{for } x > b \end{cases} \\ &= \begin{cases} 0, & \text{for } x < a; \\ \frac{\pi}{2}, & \text{for } x = a; \text{ indeterminable!} \\ \pi, & \text{for } a < x < b; \\ \frac{\pi}{2}, & \text{for } x = b; \text{ indeterminable!} \\ 0, & \text{for } x > b. \end{cases} \end{aligned}$$

Consequently,

$$\begin{aligned} \lim_{T \rightarrow \infty} I_T &= \frac{1}{\pi} \int_{-\infty}^{\infty} \psi_{a,b}(x) dF_X(x) \\ &= \frac{1}{2} \Pr[X = a] + \Pr[a < X < b] + \frac{1}{2} \Pr[X = b]. \end{aligned}$$

## Inversion and uniqueness theorem

26-28

The proof is completed by noting that  $\Pr[X = a] = \Pr[X = b] = 0$ .  $\square$

### Remarks:

- We can tell more from the proof (than from the statement of the theorem).
- For example,

**Theorem** If  $\int_{-\infty}^{\infty} |\varphi_X(t)| dt < \infty$ , then no point mass exists.  
I.e.,  $\Pr[X = a] = 0$  for every  $a \in \mathfrak{R}$ .

### Proof:

## Inversion and uniqueness theorem

26-29

$$\begin{aligned}
 |e^{ix} - 1| &\leq \min \left\{ \frac{1}{1!}|x|, \frac{1}{0!}2|x|^0 \right\} \\
 |e^{ix} - (1 + ix)| &\leq \min \left\{ \frac{1}{2!}|x|^2, \frac{1}{1!}2|x| \right\} \\
 \left| e^{ix} - \left( 1 + ix + \frac{1}{2}(ix)^2 \right) \right| &\leq \min \left\{ \frac{1}{3!}|x|^3, \frac{1}{2!}2|x|^2 \right\} \\
 &\vdots
 \end{aligned}$$

$$\begin{aligned}
 \frac{1}{2} \Pr[X = a] + \Pr[a < X < b] + \frac{1}{2} \Pr[X = b] &= \lim_{T \rightarrow \infty} \frac{1}{2\pi} \int_{-T}^T \frac{e^{-ita} - e^{-itb}}{it} \varphi_X(t) dt \\
 &\leq \limsup_{T \rightarrow \infty} \frac{1}{2\pi} \int_{-T}^T \left| \frac{e^{-ita} - e^{-itb}}{it} \right| |\varphi_X(t)| dt \\
 &\leq \frac{1}{2\pi} \int_{-\infty}^{\infty} \left| \frac{e^{it(b-a)} - 1}{t(b-a)} \right| |b-a| |\varphi_X(t)| dt \\
 &\leq \frac{|b-a|}{2\pi} \int_{-\infty}^{\infty} |\varphi_X(t)| dt.
 \end{aligned}$$

Thus, when taking  $a = b$ , we immediately obtain  $\Pr[X = a] \leq 0$ .  $\square$

# Inversion and uniqueness theorem

26-30

- Another example of “We can tell more from the proof.” is:

**Theorem** If  $\int_{-\infty}^{\infty} |\varphi_X(t)| dt < \infty$ , then the random variable  $X$  has density  $f$ , and its density (can be made to) satisfies:

1.  $f_X(x) = \frac{1}{2\pi} \int_{-\infty}^{\infty} \varphi_X(t) e^{-itx} dt$ ;
2.  $f_X(x) = F'_X(x)$  for every  $x \in \mathfrak{R}$ ;
3.  $f_X(x)$  is uniformly continuous for  $x \in \mathfrak{R}$ .

**Proof:** First, from Slide 26-28, we know that random variable  $X$  has no point mass. Then, by Theorem 26.2, we have that for every  $x$  (as  $\Pr[X = x] = 0$  and  $\Pr[X = x + h] = 0$ )

$$\frac{F_X(x+h) - F_X(x)}{h} = \lim_{T \rightarrow \infty} \frac{1}{2\pi} \int_{-\infty}^{\infty} I_{[-T, T]} \frac{e^{-itx} - e^{-it(x+h)}}{ith} \varphi_X(t) dt.$$

As

$$\left| I_{[-T, T]} \frac{e^{-itx} - e^{-it(x+h)}}{ith} \varphi_X(t) \right| \leq \left| \frac{e^{ith} - 1}{th} \right| |\varphi_X(t)| \leq |\varphi_X(t)|,$$

which is integrable with respect to Lebesgue measure, dominated convergence

## Inversion and uniqueness theorem

26-31

theorem implies that

$$\frac{F_X(x+h) - F_X(x)}{h} = \frac{1}{2\pi} \int_{-\infty}^{\infty} \frac{e^{-itx} - e^{-it(x+h)}}{ith} \varphi_X(t) dt.$$

Using dominated convergence theorem again with respect to  $h$  yields:

$$\begin{aligned} \lim_{h \rightarrow 0} \frac{F_X(x+h) - F_X(x)}{h} &= \frac{1}{2\pi} \int_{-\infty}^{\infty} \lim_{h \rightarrow 0} \frac{e^{-itx} - e^{-it(x+h)}}{ith} \varphi_X(t) dt \\ &= \frac{1}{2\pi} \int_{-\infty}^{\infty} \varphi_X(t) \frac{-1}{it} \left( \lim_{h \rightarrow 0} \frac{e^{-it(x+h)} - e^{-itx}}{h} \right) dt \\ &= \frac{1}{2\pi} \int_{-\infty}^{\infty} \varphi_X(t) e^{-itx} dt. \end{aligned}$$

We can similarly show that:

$$\lim_{h \rightarrow 0} \frac{F_X(x) - F_X(x-h)}{h} = \frac{1}{2\pi} \int_{-\infty}^{\infty} \varphi_X(t) e^{-itx} dt.$$

Accordingly,

$$F'_X(x) = \frac{1}{2\pi} \int_{-\infty}^{\infty} \varphi_X(t) e^{-itx} dt.$$

## Inversion and uniqueness theorem

26-32

- *Claim:*  $F'_X(x)$  is uniformly continuous in  $x \in \mathfrak{R}$ .

*Proof:*

$$\begin{aligned} |F'_X(x+h) - F'_X(x)| &= \frac{1}{2\pi} \left| \int_{-\infty}^{\infty} \varphi_X(t) e^{it(x+h)} dt - \int_{-\infty}^{\infty} \varphi_X(t) e^{itx} dt \right| \\ &= \frac{1}{2\pi} \left| \int_{-\infty}^{\infty} \varphi_X(t) e^{itx} (e^{iht} - 1) dt \right| \\ &\leq \frac{1}{2\pi} \int_{-\infty}^{\infty} |\varphi_X(t)| |e^{itx}| |e^{iht} - 1| dt \\ &= \frac{\int_{-\infty}^{\infty} |\varphi_X(t)| dt}{2\pi} \int_{-\infty}^{\infty} |e^{iht} - 1| f_U(t) dt \\ &\quad \text{where } f_U(t) = |\varphi_X(t)| / \int_{-\infty}^{\infty} |\varphi_X(t)| dt \\ &= \frac{1}{\pi} \left( \int_{-\infty}^{\infty} |\varphi_X(t)| dt \right) E[|\sin(hU/2)|], \end{aligned}$$

where the upper bound is independent of  $x$ . ■

## Inversion and uniqueness theorem

26-33

- The proof is then completed by quoting the following theorem. In other words, since  $F'$  satisfies that

$$\int_a^b F'(x)dx = F(b) - F(a)$$

for every  $a, b \in \mathfrak{R}$ , it is surely a density of  $X$ . □

**Theorem** (See Page 224 in Section 17) If  $F$  is a function with continuous derivative  $F'$ , then

$$\int_a^b F'(x)dx = F(b) - F(a).$$

- Note that the density is not unique. Any function  $g$  satisfying

$$\int_a^b g(x)dx = F(b) - F(a)$$

for every  $a, b \in \mathfrak{R}$  is a density of  $X$ .

# Inversion and uniqueness theorem

26-34

Summary of properties of cdf  $F$

- $F$  is differentiable almost everywhere.

**Theorem (H. L. Royden, *Real Analysis*, 3rd edition, pp. 100, 1988)** Let  $g$  be an increasing real-valued function on the interval  $[a, b]$ . Then,  $g$  is differentiable almost everywhere. The derivative  $g'$  is measurable, and

$$\int_a^b g'(x)dx \leq g(b) - g(a).$$

By this theorem, together with the fact that the number of intervals that  $F$  is increasing is countable, cdf  $F$  is almost everywhere differentiable.

- $F$  is not necessarily differentiable on every  $x$ .
- $F$  may not have density.

## Inversion and uniqueness theorem

26-35

- If  $F$  has density  $f$ , then  $F' = f$  almost everywhere.
- If  $F$  has continuous density  $f$ , then  $F' = f$  everywhere.

By definition of density,

$$\frac{1}{h} \int_x^{x+h} f(x) dx = \frac{F(x+h) - F(x)}{h}.$$

This can be used to show the above two statements.

- If  $F'$  is continuous, then  $F'$  (can be made to) be the density of  $F$ .

### Remarks

- The **tail** behavior of the characteristic function determines the **smoothness** of  $f_X$ .
- The **tail** behavior of the density (i.e.,  $f_X$ ) determines the **smoothness** of  $\varphi_X$ .

## Characteristic functions of some known distributions 26-36

• **Standard normal:** 
$$\begin{cases} f_X(x) = \frac{1}{\sqrt{2\pi}}e^{-x^2/2} \text{ for } -\infty < x < \infty. \\ \varphi_X(t) = e^{-t^2/2}. \end{cases}$$

First,

$$\int_{-\infty}^{\infty} |\varphi_X(t)| dt = \int_{-\infty}^{\infty} e^{-t^2/2} dt = \sqrt{2\pi} < \infty.$$

Hence,  $f_X(x)$  can be recovered from  $\frac{1}{2\pi} \int_{-\infty}^{\infty} \varphi_X(t)e^{-itx} dt$ , and is also uniformly continuous.

As  $\varphi_X(t)$  decays exponentially fast at  $|t| \rightarrow \infty$ ,  $f_X(x)$  has all orders of derivative and is very, very smooth in its shape.

## Characteristic functions of some known distributions 26-37

Furthermore,

$$\begin{aligned}
 \frac{|t|^n E[|X|^n]}{n!} &= \frac{|t|^n \frac{2^{n/2} \Gamma((n+1)/2)}{\sqrt{\pi}}}{n!} \\
 &= \begin{cases} \frac{|t|^{2j-1} 2^j (j-1)!}{(2j-1)! \sqrt{2\pi}} & \text{for } n = 2j - 1 \text{ odd;} \\ \frac{|t|^{2j} 2^j \Gamma((2j+1)/2)}{(2j)! \sqrt{\pi}} & \text{for } n = 2j \text{ even} \end{cases} \\
 &\leq \max \left\{ \frac{1}{|t|}, 1 \right\} \frac{(2|t|^2)^j}{j!} \text{ respectively for } n = 2j - 1 \text{ odd and } n = 2j \text{ even} \\
 &\leq \max \left\{ \frac{1}{|t|}, 1 \right\} \left( \frac{2e|t|^2}{j} \right)^j \text{ since } j! > (j/e)^j \\
 &\xrightarrow{n \rightarrow \infty} 0
 \end{aligned}$$

### Stirling's approximation

$$\sqrt{2n\pi} \left( \frac{n}{e} \right)^n < n! < \sqrt{2n\pi} \left( \frac{n}{e} \right)^n \left( 1 + \frac{1}{12n-1} \right).$$

**Gamma function**  $\Gamma(x+1) = x \cdot \Gamma(x)$  for  $x > 0$  and  $\Gamma(1/2) = \sqrt{\pi}$ .

## Characteristic functions of some known distributions 26-38

implies that

$$\begin{aligned}\varphi_X(t) &= \sum_{k=0}^{\infty} \frac{(it)^k}{k!} E[X^k] \\ &= \sum_{k=0}^{\infty} \frac{(it)^k}{k!} \left( \frac{2^{(k-2)/2} (1 + (-1)^k) \Gamma((k+1)/2)}{\sqrt{\pi}} \right) \\ &= \sum_{j=0}^{\infty} \frac{(-1)^j}{(2j)!} \left( \frac{2^j \Gamma((2j+1)/2)}{\sqrt{\pi}} \right) t^{2j} \quad (\text{Take } k = 2j) \\ &= \sum_{j=0}^{\infty} \frac{1}{j!} \left( -\frac{t^2}{2} \right)^j \quad \left( = e^{-t^2/2} \right).\end{aligned}$$

## Characteristic functions of some known distributions 26-39

• **Uniform:** 
$$\begin{cases} f_X(x) = 1 \text{ for } 0 < x < 1. \\ \varphi_X(t) = \frac{e^{it} - 1}{it}. \end{cases}$$

First,

$$\int_{-\infty}^{\infty} |\varphi_X(t)| dt = \int_{-\infty}^{\infty} \frac{|\sin(t/2)|}{|t/2|} dt = 4 \int_0^{\infty} \frac{|\sin(s)|}{s} ds = \infty.$$

Hence,  $f_X(x)$  cannot be recovered from  $\frac{1}{2\pi} \int_{-\infty}^{\infty} \varphi_X(t) e^{-itx} dt$ , and is not uniformly continuous as it has jumps at  $x = 0$  and  $x = 1$ .

In addition,

$$\lim_{n \rightarrow \infty} \frac{|t|^n E[|X|^n]}{n!} = \lim_{n \rightarrow \infty} \frac{|t|^n (1/(n+1))}{n!} = \lim_{n \rightarrow \infty} \frac{|t|^n}{(n+1)!} = 0$$

implies that

$$\begin{aligned} \varphi_X(t) &= \sum_{k=0}^{\infty} \frac{(it)^k}{k!} E[X^k] \\ &= \sum_{k=0}^{\infty} \frac{(it)^k}{k!} \left( \frac{1}{k+1} \right) \\ &= \frac{1}{it} \sum_{k=0}^{\infty} \frac{(it)^{k+1}}{(k+1)!} \quad \left( = \frac{e^{it} - 1}{it} \right). \end{aligned}$$

## Characteristic functions of some known distributions 26-40

• **Exponential:** 
$$\begin{cases} f_X(x) = e^{-x} \text{ for } 0 < x < \infty. \\ \varphi_X(t) = \frac{1}{1-it}. \end{cases}$$

First,

$$\int_{-\infty}^{\infty} \left| \frac{1}{1-it} \right| dt = \int_{-\infty}^{\infty} \frac{1}{\sqrt{1+t^2}} dt = 2 \int_0^{\infty} \frac{1}{\sqrt{1+t^2}} dt = \infty.$$

Hence,  $f_X(x)$  cannot be recovered from  $\frac{1}{2\pi} \int_{-\infty}^{\infty} \varphi_X(t) e^{-itx} dt$ , and is not uniformly continuous as it has a jump at  $x = 0$ .

In addition, for  $|t| < 1$ ,

$$\lim_{n \rightarrow \infty} \frac{|t|^n E[|X|^n]}{n!} = \lim_{n \rightarrow \infty} \frac{|t|^n n!}{n!} = \lim_{n \rightarrow \infty} |t|^n = 0$$

$$\left( E[e^{|tX|}] = \int_0^{\infty} e^{|t|x} e^{-x} dx = \int_0^{\infty} e^{-(1-|t|)x} dx = \frac{1}{1-|t|} < \infty \right)$$

implies that for  $|t| < 1$ ,

$$\varphi_X(t) = \sum_{k=0}^{\infty} \frac{(it)^k}{k!} E[X^k] = \sum_{k=0}^{\infty} \frac{(it)^k}{k!} (k!) = \sum_{k=0}^{\infty} (it)^k = \frac{1}{1-it}.$$

## Characteristic functions of some known distributions 26-41

- **Double exponential (Bilateral exponential):** 
$$\begin{cases} f_X(x) = \frac{1}{2}e^{-|x|} \text{ for } -\infty < x < \infty. \\ \varphi_X(t) = \frac{1}{1+t^2}. \end{cases}$$

First,

$$\int_{-\infty}^{\infty} \left| \frac{1}{1+t^2} \right| dt = \pi < \infty.$$

Hence,  $f_X(x)$  can be recovered from  $\frac{1}{2\pi} \int_{-\infty}^{\infty} \varphi_X(t)e^{-itx} dt$ , and also is uniformly continuous.

But it is not differentiable at  $x = 0$ . (Check “tail” of  $\varphi(t)$ !)

In addition, for  $|t| < 1$ ,

$$\lim_{n \rightarrow \infty} \frac{|t|^n E[|X|^n]}{n!} = \lim_{n \rightarrow \infty} \frac{|t|^n (n!)}{n!} = \lim_{n \rightarrow \infty} |t|^n = 0$$

$$\left( E[e^{tX}] = \int_{-\infty}^{\infty} e^{t|x|} \frac{1}{2} e^{-|x|} dx = \int_0^{\infty} e^{-(1-|t|)x} dx = \frac{1}{1-|t|} < \infty \right)$$

implies that for  $|t| < 1$ ,

$$\varphi_X(t) = \sum_{k=0}^{\infty} \frac{(it)^k}{k!} E[X^k] = \sum_{k=0}^{\infty} \frac{(it)^k}{k!} \left( \frac{1}{2} (1 + (-1)^k) k! \right) = \sum_{j=0}^{\infty} (it)^{2j} = \frac{1}{1+t^2}.$$

## Characteristic functions of some known distributions 26-42

• **Cauchy:** 
$$\begin{cases} f_X(x) = \frac{1}{\pi(1+x^2)} \text{ for } -\infty < x < \infty. \\ \varphi_X(t) = e^{-|t|}. \end{cases}$$

First,

$$\int_{-\infty}^{\infty} |e^{-|t|}| dt = 2 < \infty.$$

Hence,  $f_X(x)$  can be recovered from  $\frac{1}{2\pi} \int_{-\infty}^{\infty} \varphi_X(t) e^{-itx} dt$ , and is uniformly continuous and differentiable (for  $\varphi_X(t)$  decays very fast at  $|t| \rightarrow \infty$  and hence  $f_X(x)$  is very smooth).

In addition,

$$\lim_{n \rightarrow \infty} \frac{|t|^n E[|X|^n]}{n!} = \begin{cases} \infty, & \text{for } |t| > 0; \\ \text{indeterminate,} & \text{for } |t| = 0, \text{ (due to the indeterminate of } 0 \times \infty) \end{cases}$$

and  $\varphi_X(t)$  exhibits no Taylor-expansion expression.

## Characteristic functions of some known distributions 26-43

• **Triangular:** 
$$\begin{cases} f_X(x) = 1 - |x| \text{ for } -1 < x < 1. \\ \varphi_X(t) = 2 \left( \frac{1 - \cos(t)}{t^2} \right). \end{cases}$$

Notably,

$$\int_{-\infty}^{\infty} 2 \left| \frac{1 - \cos(t)}{t^2} \right| dt = 2\pi < \infty.$$

Hence,  $f_X(x)$  can be recovered from  $\frac{1}{2\pi} \int_{-\infty}^{\infty} \varphi_X(t) e^{-itx} dt$ , and also is uniformly continuous.

But it is not differentiable at  $x = -1, 0, 1$ . (Check “tail” of  $\varphi(t)$ !)

In addition,

$$\lim_{n \rightarrow \infty} \frac{|t|^n E[|X|^n]}{n!} = \lim_{n \rightarrow \infty} \frac{|t|^n (2/[(n+2)(n+1)])}{n!} = \lim_{n \rightarrow \infty} \frac{2|t|^n}{(n+2)!} = 0$$

implies that

$$\varphi_X(t) = \sum_{k=0}^{\infty} \frac{(it)^k}{k!} E[X^k] = \sum_{k=0}^{\infty} \frac{(it)^k}{k!} \left( \frac{1 + (-1)^k}{(k+1)(k+2)} \right) = 2 \sum_{j=0}^{\infty} \frac{(-)^j (t^2)^j}{(2j+2)!} = 2 \frac{1 - \cos(t)}{t^2}.$$

## Characteristic functions of some known distributions 26-44

• **No name:** 
$$\begin{cases} f_X(x) = \frac{1}{\pi} \left( \frac{1 - \cos(x)}{x^2} \right) & \text{for } -\infty < x < \infty. \\ \varphi_X(t) = (1 - |t|)I_{(-1,1)}(t). \end{cases}$$

Notably,

$$\int_{-\infty}^{\infty} |(1 - |t|)I_{(-1,1)}(t)| dt = 1 < \infty.$$

Hence,  $f_X(x)$  can be recovered from  $\frac{1}{2\pi} \int_{-\infty}^{\infty} \varphi_X(t)e^{-itx} dt$ , and also is uniformly continuous and differentiable (for  $\varphi_X(t)$  decays very, very fast at  $|t| \rightarrow \infty$ , and hence  $f_X(x)$  has all orders of derivatives and is very, very smooth).

In addition,  $E[|X|^n] = \infty$  for  $n \geq 3$ ; hence,

$$\lim_{n \rightarrow \infty} \frac{|t|^n E[|X|^n]}{n!} = \begin{cases} \infty, & \text{for } |t| > 0; \\ \text{indeterminate,} & \text{for } |t| = 0, \end{cases}$$

and  $\varphi_X(t)$  exhibits no Taylor-expansion expression.

# Continuity theorem

26-45

## Theorem 26.3 (Continuity theorem)

$X_n \Rightarrow X$  if, and only if,  $\varphi_{X_n}(t) \rightarrow \varphi_X(t)$  for every  $t \in \mathfrak{R}$ .

**Proof:**

1.  $X_n \Rightarrow X$  implies  $\varphi_{X_n}(t) \xrightarrow{n \rightarrow \infty} \varphi_X(t)$ .

**Theorem 25.8 (A rephrased version)** The following two conditions are equivalent.

- $F_n \Rightarrow F$ ;
- $\lim_{n \rightarrow \infty} \int_{\mathfrak{R}} f(x) dF_n(x) = \int_{\mathfrak{R}} f(x) dF(x)$  for every bounded, continuous real function  $f$ .

From Theorem 25.8,  $X_n \Rightarrow X$  implies that

$$\lim_{n \rightarrow \infty} \int_{\mathfrak{R}} \cos(tx) dF_{X_n}(x) = \int_{\mathfrak{R}} \cos(tx) dF_X(x)$$

and

$$\lim_{n \rightarrow \infty} \int_{\mathfrak{R}} \sin(tx) dF_{X_n}(x) = \int_{\mathfrak{R}} \sin(tx) dF_X(x).$$

These two jointly give that  $\varphi_{X_n}(t) \xrightarrow{n \rightarrow \infty} \varphi_X(t)$ .

## Continuity theorem

26-46

2.  $\varphi_{X_n}(t) \xrightarrow{n \rightarrow \infty} \varphi_X(t)$  **implies**  $X_n \Rightarrow X$  .

We will first show that  $\varphi_{X_n}(t) \xrightarrow{n \rightarrow \infty} \varphi_X(t)$  implies  $\{X_n\}_{n \geq 1}$  (or equivalently,  $\{F_n\}_{n \geq 1}$ ) is tight. Then, by Helly's Theorem, there exists a subsequence  $\{X_{n_k}\}_{k \geq 1}$  such that  $X_{n_k} \Rightarrow Y$ , where  $Y$  is a random variable with legitimate cdf  $F_Y(\cdot)$ .

**Theorem 25.9 (Helly's theorem)** For every sequence  $\{F_n\}_{n=1}^{\infty}$  of distribution functions, there exists a subsequence  $\{F_{n_k}\}_{k=1}^{\infty}$  and a non-decreasing, right-continuous function  $F$  (not necessarily a cdf) such that

$$\lim_{k \rightarrow \infty} F_{n_k}(x) = F(x)$$

for every continuous points of  $F$ .

**Theorem 25.10 (rephrased version)** Tightness of  $\{F_{n_k}\}_{k=1}^{\infty}$  is a necessary and sufficient condition for the limit  $F(\cdot)$  in Helly's theorem to be a cdf.

**Definition (tightness)** A sequence of cdf's is said to be *tight* if for any  $\varepsilon > 0$ , there exist  $x$  and  $y$  such that

$$F_n(x) < \varepsilon \text{ and } F_n(y) > 1 - \varepsilon \text{ for all sufficiently large } n.$$

## Continuity theorem

26-47

By Fubini's theorem,

$$\begin{aligned} \frac{1}{u} \int_{-u}^u (1 - \varphi_{X_n}(t)) dt &= \frac{1}{u} \int_{-u}^u \left( \int_{-\infty}^{\infty} (1 - e^{itx}) dF_n(x) \right) dt \\ &= \frac{1}{u} \int_{-\infty}^{\infty} \left( \int_{-u}^u (1 - e^{itx}) dt \right) dF_n(x) \\ &= 2 \int_{-\infty}^{\infty} \left( 1 - \frac{\sin(ux)}{ux} \right) dF_n(x) \\ &\quad \text{(This shows that } \frac{1}{u} \int_{-u}^u (1 - \varphi_{X_n}(t)) dt \text{ is a non-negative} \\ &\quad \text{real number.)} \\ &\geq 2 \int_{[|x| \geq 2/u]} \left( 1 - \frac{\sin(ux)}{ux} \right) dF_n(x) \quad \left( \text{since } 1 - \frac{\sin(ux)}{ux} \geq 0 \right) \\ &\geq 2 \int_{[|x| \geq 2/u]} \left( 1 - \frac{1}{|ux|} \right) dF_n(x) \\ &\geq \int_{[|x| \geq 2/u]} dF_n(x) \\ &= \Pr \left[ |X_n| \geq \frac{2}{u} \right]. \end{aligned}$$

## Continuity theorem

26-48

Checking for Fubini's theorem:

$$\int_{-u}^u \int_{-\infty}^{\infty} |1 - e^{itx}| dF_n(x) dx \leq \int_{-u}^u 2 dx = 4u < \infty.$$

With the above inequality, we next prove that the sequence of probability measures  $\{F_{X_n}\}_{n=1}^{\infty}$  is tight.

Fix an  $\varepsilon > 0$ . Since  $\varphi_X(t)$  is (uniformly) continuous and  $\varphi_X(0) = 1$ , there exists  $u$  (small enough) such that

$$\frac{1}{u} \int_{-u}^u (1 - \varphi_X(t)) dt < \frac{\varepsilon}{2}.$$

Continuity at  $t = 0$  means that for  $\varepsilon/4 > 0$ , there exists  $u > 0$  such that  $|1 - \varphi_X(t)| < \varepsilon/4$  for  $-u \leq t \leq u$ .

By bounded convergence theorem,

$$\frac{1}{u} \int_{-u}^u (1 - \varphi_{X_n}(t)) dt \xrightarrow{n \rightarrow \infty} \frac{1}{u} \int_{-u}^u (1 - \varphi_X(t)) dt.$$

## Continuity theorem

26-49

Hence, there exists  $N_0$  such that for  $n > N_0$ ,

$$\frac{1}{u} \int_{-u}^u (1 - \varphi_{X_n}(t)) dt < \varepsilon,$$

which by the previously obtained inequality confirms that

$$\Pr \left[ |X_n| > \frac{2}{u} \right] < \varepsilon \text{ for all } n \geq N_0,$$

namely,  $\{F_{X_n}\}_{n=1}^{\infty}$  is tight.

Now suppose that  $X_{n_k} \Rightarrow Y$  for some  $Y$ . Then, by the first part of the proof, we obtain that for every  $t$ ,

$$\varphi_{X_{n_k}}(t) \xrightarrow{k \rightarrow \infty} \varphi_Y(t).$$

However, we are given that for every  $t$ ,

$$\varphi_{X_{n_k}}(t) \xrightarrow{k \rightarrow \infty} \varphi_X(t).$$

These two limits should coincide in every  $t$ , i.e.,  $\varphi_X(t) = \varphi_Y(t)$ .

We can then infer by the Uniqueness Theorem that  $X_{n_k} \Rightarrow X$ .

## Continuity theorem

26-50

**Theorem 26.2 (Uniqueness theorem)** For any  $a$  and  $b$  with  $\Pr[X = a] = \Pr[X = b] = 0$  and  $a < b$ ,

$$\Pr[a < X \leq b] = \lim_{T \rightarrow \infty} \frac{1}{2\pi} \int_{-T}^T \frac{e^{-ita} - e^{-itb}}{it} \varphi_X(t) dt,$$

where  $\varphi_X(t)$  is the characteristic function of random variable  $X$ .

In fact, we know by  $\varphi_{X_n}(t) \xrightarrow{n \rightarrow \infty} \varphi_X(t)$  and the Uniqueness Theorem that for every subsequence  $\{n_j\}_{j \geq 1}$  satisfying that  $\{X_{n_j}\}_{j \geq 1}$  converges in distribution to some limiting random variable, this limiting random variable should be  $X$ .

Finally, we will prove  $X_n \Rightarrow X$  by contradiction.

Suppose  $X_n$  does not converge in distribution to  $X$ . Then, there exists  $x$  with  $\Pr[X = x] = 0$  such that

$$\Pr[X_n \leq x] \not\rightarrow \Pr[X \leq x],$$

which implies the existence of subsequence  $\{n_j\}_{j \geq 1}$  such that

$$\liminf_{j \rightarrow \infty} |\Pr[X_{n_j} \leq x] - \Pr[X \leq x]| > 0.$$

## Continuity theorem

26-51

However, for this  $\{X_{n_j}\}_{j \geq 1}$ , we can find a further subsequence such that  $X_{n_{j_k}} \Rightarrow X$ . This contradicts to

$$\liminf_{j \rightarrow \infty} |\Pr[X_{n_j} \leq x] - \Pr[X \leq x]| > 0.$$

We therefore obtain the desired contradiction. □

## Continuity theorem

26-52

- The next two corollaries can be proved similarly using the above proof.
- But their statements could be more useful in applications.

**Corollary 1** Suppose a sequence of characteristic functions  $\{\varphi_n(t)\}_{n=1}^{\infty}$  has limits in every  $t$ , namely  $\lim_{n \rightarrow \infty} \varphi_n(t)$  exists for every  $t$ .

Define

$$g(t) = \lim_{n \rightarrow \infty} \varphi_n(t).$$

Then if  $g(t)$  is continuous at  $t = 0$ , then there exists a probability measure  $\mu$  such that

$$\mu_n \Rightarrow \mu, \text{ and } \mu \text{ has characteristic function } g$$

where  $\mu_n$  is the probability measure corresponding to characteristic function  $\varphi_n(\cdot)$ .

**Proof:** Notably, in the second part of the proof (i.e., the proof of the tightness of  $\{\mu_n\}_{n=1}^{\infty}$ ), the only condition required is that  $g(t)$  (i.e.,  $\varphi_X(t)$  in the previous proof) is continuous at  $t = 0$  and  $g(0) = 1$ . So the same proof can be used to show this corollary.  $\square$

## Continuity theorem

26-53

- In the proof, the continuity of  $g$  was used to establish **tightness**. Hence, if  $\{F_{X_n}\}_{n=1}^{\infty}$  is assumed tight in the first place, then the corollary apparently holds.

**Corollary 2** Suppose a sequence of characteristic functions  $\{\varphi_n(t)\}_{n=1}^{\infty}$  has limits in every  $t$ , namely  $\lim_{t \rightarrow \infty} \varphi_n(t)$  exists for every  $t$ .

Define

$$g(t) = \lim_{t \rightarrow \infty} \varphi_{X_n}(t).$$

Then if  $\{\mu_n\}_{n=1}^{\infty}$  is tight, then there exists a probability measure  $\mu$  such that

$$\mu_n \Rightarrow \mu, \text{ and } \mu \text{ has characteristic function } g$$

where  $\mu_n$  is the probability measure corresponding to characteristic function  $\varphi_n(\cdot)$ .

**Observation** If  $\{X_n\}_{n=1}^{\infty}$  is uniformly bounded, then  $\{F_{X_n}\}_{n=1}^{\infty}$  is tight.

## Continuity theorem

26-54

**Example 26.2** Let  $X_n$  be uniformly distributed over  $(-n, n)$ .

$$\text{Then } \varphi_{X_n}(t) = \int_{-n}^n e^{itx} \frac{1}{2n} dx = \frac{\sin(nt)}{nt}.$$

Hence, the limit of  $\varphi_{X_n}(t)$  exists, and is equal to:

$$g(t) = \lim_{n \rightarrow \infty} \varphi_{X_n}(t) = \lim_{n \rightarrow \infty} \frac{\sin(nt)}{nt} = \begin{cases} 0, & \text{if } t \neq 0; \\ \lim_{n \rightarrow \infty} \lim_{t \rightarrow 0} \cos(nt), & \text{if } t = 0 \end{cases} = \begin{cases} 0, & \text{if } t \neq 0; \\ 1, & \text{if } t = 0 \end{cases}$$

In this example,  $\{F_{X_n}\}_{n=1}^{\infty}$  is not tight,  
and as expected,  $g(\cdot)$  is not continuous at  $t = 0$ .

Notably, the probability measures of  $X_n$ 's *converges vaguely* to “all-zero measure.”

Actually,  $g(t)$  cannot be obtained by integrating  $e^{itx}$  with respect to the true all-zero-measure for  $x \in \mathfrak{R}$ , but a (bizarre) measure that is zero everywhere and integrates to 1 over the entire range. Hence, I put double quotation mark here to indicate it is not the usual all-zero measure.

## Applying Fourier series to probabilities

26-55

**Theorem** Suppose the support of the distribution of random variable  $X$  is contained in  $[0, 2\pi]$ .

Then

$$\Pr[a < X \leq b] = \lim_{m \rightarrow \infty} \int_a^b \sigma_m(t) dt,$$

if  $\Pr[X = a] = \Pr[X = b] = 0$  and  $0 < a < b < 2\pi$ ,

where

$$\sigma_m(t) = \frac{1}{2\pi m} \int_0^{2\pi} \frac{\sin^2[m(x-t)/2]}{\sin^2[(x-t)/2]} dF_X(x).$$

**Proof:** By Fubini's theorem,

$$\begin{aligned} \int_a^b \sigma_m(t) dt &= \int_a^b \left( \frac{1}{2\pi m} \int_0^{2\pi} \frac{\sin^2[m(x-t)/2]}{\sin^2[(x-t)/2]} dF_X(x) \right) dt \\ &= \int_0^{2\pi} \frac{1}{2\pi m} \left( \int_a^b \frac{\sin^2[m(x-t)/2]}{\sin^2[(x-t)/2]} dt \right) dF_X(x) \\ &= \int_0^{2\pi} \frac{1}{2\pi m} \left( \int_a^b \frac{\sin^2[m(t-x)/2]}{\sin^2[(t-x)/2]} dt \right) dF_X(x) \\ &= \int_0^{2\pi} \frac{1}{2\pi m} \left( \int_{a-x}^{b-x} \frac{\sin^2(ms/2)}{\sin^2(s/2)} ds \right) dF_X(x). \end{aligned}$$

## Applying Fourier series to probabilities

26-56

By dominated convergence theorem, for any  $\delta \in (0, 2\pi)$ ,

$$\lim_{m \rightarrow \infty} \frac{1}{2\pi m} \int_{\delta < |s| < 2\pi} \frac{\sin^2(ms/2)}{\sin^2(s/2)} ds = \int_{\delta < |s| < 2\pi} \frac{1}{2\pi \sin^2(s/2)} \left( \lim_{m \rightarrow \infty} \frac{\sin^2(ms/2)}{m} \right) ds = 0.$$

It can be shown (cf. the next slide) that for integer  $m$ ,

$$\begin{aligned} \frac{1}{2\pi m} \int_{-\pi}^{\pi} \frac{\sin^2(ms/2)}{\sin^2(s/2)} ds &= \frac{1}{2\pi m} \int_{-\pi}^{\pi} \left( \sum_{\ell=0}^{m-1} \sum_{k=-\ell}^{\ell} e^{isk} \right) ds = \frac{1}{2\pi m} \sum_{\ell=0}^{m-1} \sum_{k=-\ell}^{\ell} \int_{-\pi}^{\pi} e^{isk} ds \\ &= \frac{1}{2\pi m} \sum_{\ell=0}^{m-1} \sum_{k=-\ell}^{\ell} \frac{2 \sin(k\pi)}{k} = \frac{1}{m} \sum_{\ell=0}^{m-1} \sum_{k=-\ell}^{\ell} \frac{\sin(k\pi)}{k\pi} = 1 \quad (\text{because } \frac{\sin(k\pi)}{k\pi} = 0 \text{ except } k = 0) \end{aligned}$$

Hence,

$$\frac{1}{2\pi m} \int_{|s| \leq \delta} \frac{\sin^2(ms/2)}{\sin^2(s/2)} ds \xrightarrow{m \rightarrow \infty} 1,$$

which implies that (note:  $-2\pi < a - x < b - x < 2\pi$ )

$$\lim_{m \rightarrow \infty} \frac{1}{2\pi m} \left( \int_{a-x}^{b-x} \frac{\sin^2(ms/2)}{\sin^2(s/2)} ds \right) = \begin{cases} 0, & \text{if } a - x > 0; \\ 1, & \text{if } a - x < 0 < b - x; \\ 0, & \text{if } b - x < 0 \end{cases} = \begin{cases} 0, & \text{if } x < a \text{ or } x > b; \\ 1, & \text{if } a < x < b. \end{cases}$$

## Applying Fourier series to probabilities

26-57

$$\begin{aligned}
 \sum_{\ell=0}^{m-1} \sum_{k=-\ell}^{\ell} e^{isk} &= \sum_{\ell=0}^{m-1} \frac{e^{-is\ell}(1 - e^{is(2\ell+1)})}{1 - e^{is}} \\
 &= \frac{1}{1 - e^{is}} \left( \sum_{\ell=0}^{m-1} e^{-is\ell} - \sum_{\ell=0}^{m-1} e^{is(\ell+1)} \right) \\
 &= \frac{1}{1 - e^{is}} \left( \frac{1 - e^{-ism}}{1 - e^{-is}} - \frac{e^{is}(1 - e^{ism})}{1 - e^{is}} \right) \\
 &= \frac{1}{1 - e^{is}} \left( \frac{e^{-is(m-1)}(1 - e^{ism})}{1 - e^{is}} - \frac{e^{is}(1 - e^{ism})}{1 - e^{is}} \right) \\
 &= \frac{e^{-ism}(1 - e^{ism})^2}{e^{is}(1 - e^{is})^2} = \frac{\sin^2(ms/2)}{\sin^2(s/2)}.
 \end{aligned}$$

As  $\Pr[X = a] = \Pr[X = b] = 0$ , we obtain from dominated convergence theorem that

$$\lim_{m \rightarrow \infty} \int_a^b \sigma_m(t) dt = \int_0^{2\pi} \left( \lim_{m \rightarrow \infty} \frac{1}{2\pi m} \int_{a-x}^{b-x} \frac{\sin^2(ms/2)}{\sin^2(s/2)} ds \right) dF_X(x) = \Pr[a < X < b].$$

□

## Discussions:

- Following from the previous theorem, the Fourier coefficients are defined by:

$$c_m = \int_0^{2\pi} e^{imx} dF_X(x) \text{ for } m = 0, \pm 1, \pm 2, \dots .$$

- $\{c_m\}_{m=0,\pm 1,\pm 2,\dots}$  can be viewed as the *values of the characteristic function for integer arguments*.

In other words,

$$c_m = \varphi_X(m),$$

where

$$\varphi_X(t) = \int_0^{2\pi} e^{itx} dF_X(x).$$

- Notably,

$$\begin{aligned} \sigma_m(t) &= \frac{1}{2\pi m} \int_0^{2\pi} \frac{\sin^2[m(x-t)/2]}{\sin^2[(x-t)/2]} dF_X(x) \\ &= \frac{1}{2\pi m} \int_0^{2\pi} \sum_{\ell=0}^{m-1} \sum_{k=-\ell}^{\ell} e^{i(x-t)k} dF_X(x) = \frac{1}{2\pi m} \sum_{\ell=0}^{m-1} \sum_{k=-\ell}^{\ell} c_k e^{-itk}. \end{aligned}$$

## Applying Fourier series to probabilities

26-59

- Hence, the distribution of a random variable with support contained in  $[0, 2\pi]$  can be uniquely determined by the **samples** of  $\varphi_X(t)$ , namely  $\{\varphi_X(m)\}_{m=0,\pm 1,\pm 2,\dots}$ .
  - **Trivial Extension:** The distribution of a random variable with bounded support can be uniquely determined by the samples of its characteristic function (if with a properly selected sampling period).
  - A drawback of using samples to determine the distribution with bounded support is that the probability masses at two end points are undetermined.

In other words, using the above theorem as an example, we can have two distinct distributions with equal positive  $\Pr[X = 0] + \Pr[X = 2\pi] > 0$ , but their “samples” are identical.

**Example**  $\Pr[X = 0] = \Pr[Y = 2\pi] = 1$ .

Then

$$\varphi_X(t) = E[e^{itX}] = 1 \text{ and } \varphi_Y(t) = E[e^{itY}] = e^{i2\pi t}.$$

However, for every integer  $m$ ,

$$1 = \varphi_X(m) = \varphi_Y(m) = e^{i2\pi m} = 1.$$

**Observation** Distributions with the same  $\Pr[X = 0] + \Pr[X = 2\pi]$  are indistinguishable using the approach of Fourier series.

## Applying Fourier series to probabilities

26-60

**Corollary** Suppose the support of the distribution of random variable  $X$  is contained in  $[0, 2\pi]$ . Then for  $0 < a < b < 2\pi$ ,

$$\frac{1}{2} \Pr[X = a] + \Pr[a < X < b] + \frac{1}{2} \Pr[X = b] = \lim_{m \rightarrow \infty} \int_a^b \sigma_m(t) dt.$$

**Proof:** Since  $\sin^2(ms/2)/\sin^2(s/2)$  is a bounded even function,

$$\frac{1}{2\pi m} \int_{-\pi}^0 \frac{\sin^2(ms/2)}{\sin^2(s/2)} ds = \frac{1}{2\pi m} \int_0^{\pi} \frac{\sin^2(ms/2)}{\sin^2(s/2)} ds.$$

Hence,

$$\frac{1}{2\pi m} \int_{-\pi}^0 \frac{\sin^2(ms/2)}{\sin^2(s/2)} ds = \frac{1}{2\pi m} \int_0^{\pi} \frac{\sin^2(ms/2)}{\sin^2(s/2)} ds = \frac{1}{2},$$

# Applying Fourier series to probabilities

which implies that

$$\lim_{m \rightarrow \infty} \frac{1}{2\pi m} \left( \int_{a-x}^{b-x} \frac{\sin^2(ms/2)}{\sin^2(s/2)} ds \right) = \begin{cases} 0, & \text{if } a - x > 0; \\ \frac{1}{2}, & \text{if } a - x = 0; \\ 1, & \text{if } a - x < 0 < b - x; \\ \frac{1}{2}, & \text{if } b - x = 0; \\ 0, & \text{if } b - x < 0 \end{cases}$$

$$= \begin{cases} 0, & \text{if } x < a \text{ or } x > b; \\ \frac{1}{2}, & \text{if } x = a \text{ or } x = b; \\ 1, & \text{if } a < x < b. \end{cases}$$

Accordingly, the corollary holds. □

**Theorem** Suppose  $\{X_n\}_{n=1}^\infty$  have supports in  $[0, 2\pi]$ , and suppose the  $m$ th Fourier coefficient  $c_m(n)$  of  $X_n$  converges to  $c_m$ . Then

$$X_n \Rightarrow X,$$

where  $X$  is the distribution determined through  $\{c_m\}_{m \text{ integer}}$ .

The distribution of  $X$  is unique except possibly in the way the mass on  $\{0, 2\pi\}$  is split on the points of 0 and  $2\pi$ .

**Proof:** Note that a sequence of random variables is tight, if their supports are uniformly bounded. □

## Uniformly distributed modulo 1

26-62

Give a sequence of real numbers  $x_1, x_2, x_3, \dots$ .

Let the probability measure  $\mu_n$  put masses  $1/n$  at points  $2\pi(x_k - \lfloor x_k \rfloor)$ .

Let the probability measure  $\mu$  be uniformly distributed over  $(0, 2\pi]$ .

Hence,

$$c_m(n) = \int_0^{2\pi} e^{imx} \mu_n(dx) = \frac{1}{n} \sum_{k=1}^n e^{i2\pi m(x_k - \lfloor x_k \rfloor)},$$

and

$$c_m = \int_0^{2\pi} e^{imx} \mu(dx) = \frac{1}{2\pi} \int_0^{2\pi} e^{imx} dx = \begin{cases} 1, & \text{if } m = 0; \\ 0, & \text{if } m \neq 0. \end{cases}$$

Therefore,  $\mu_n \Rightarrow \mu$ , if

$$\text{for } m \neq 0, \quad \frac{1}{n} \sum_{k=1}^n e^{i2\pi m(x_k - \lfloor x_k \rfloor)} \xrightarrow{n \rightarrow \infty} 0.$$

This is named **Weyl's criterion**.

## Uniformly distributed modulo 1

26-63

Now if  $x_k = k\theta$ , where  $\theta$  is irrational, then  $e^{i2\pi m\theta} \neq 1$  for  $m \neq 0$ , and

$$\begin{aligned} \frac{1}{n} \sum_{k=1}^n e^{i2\pi m(x_k - [x_k])} &= \frac{1}{n} \sum_{k=1}^n e^{i2\pi m(k\theta - [k\theta])} \\ &= \frac{1}{n} \sum_{k=1}^n e^{i2\pi mk\theta} \\ &= \frac{1}{n} e^{i2\pi m\theta} \frac{1 - e^{i2\pi m\theta n}}{1 - e^{i2\pi m\theta}} \\ &= \frac{1}{n} e^{i2\pi m\theta} \frac{e^{i\pi m\theta n} (e^{-i\pi m\theta n} - e^{i\pi m\theta n})}{e^{i\pi m\theta} (e^{-i\pi m\theta} - e^{i\pi m\theta})} \\ &= e^{i\pi m\theta(n+1)} \frac{\sin(\pi m\theta n)}{n \sin(\pi m\theta)} \\ &\xrightarrow{n \rightarrow \infty} 0. \end{aligned}$$

□

# Fourier Transform

26-64

- **Question:** Is (inverse) Fourier transform always continuous, just like the characteristic function?

**Answer:** No. Think of the (inverse) Fourier transform of  $\sin(x)/x$ .

$$\int_{-\infty}^{\infty} \frac{\sin(x)}{x} e^{itx} dx = \begin{cases} 0, & \text{if } |t| > 1; \\ \frac{\pi}{2}, & \text{if } |t| = 1; \\ \pi, & \text{if } |t| < 1. \end{cases}$$

If  $\int_{-\infty}^{\infty} |f(x)| dx < \infty$ , then the (inverse) Fourier transform is uniformly continuous.

$$\begin{aligned} \left| \int_{-\infty}^{\infty} e^{i(t+h)x} f(x) dx - \int_{-\infty}^{\infty} e^{itx} f(x) dx \right| &= \left| \int_{-\infty}^{\infty} (e^{ihx} - 1) e^{itx} f(x) dx \right| \\ &\leq \int_{-\infty}^{\infty} |(e^{ihx} - 1)| \cdot |e^{itx}| \cdot |f(x)| dx \\ &= \int_{-\infty}^{\infty} |(e^{ihx} - 1)| |f(x)| dx \\ &= \left( \int_{-\infty}^{\infty} |f(x)| dx \right) \int_{-\infty}^{\infty} |(e^{ihx} - 1)| dF(x), \end{aligned}$$

where  $dF(x) = |f(x)| dx / \left( \int_{-\infty}^{\infty} |f(x)| dx \right)$ .

# Fourier Transform

26-65

- **Question:** Does (inverse) Fourier transform has Taylor expansion?

**Answer:** This section learns us that if

1.  $\lim_{n \rightarrow \infty} \frac{|t|^n \int_{\mathbb{R}} |x|^n |f(x)| dx}{n!} = 0$ , or
2.  $\int_{\mathbb{R}} e^{|t||x|} |f(x)| dx < \infty$ ,

then Fourier transform has Taylor expansion at  $t = 0$ .

We also learn that even if Fourier transform does not equal its infinite Taylor sum, we can still express it in partial Taylor sum up to order  $n$ , if

$$\int_{\mathbb{R}} |x|^n |f(x)| dx < \infty.$$

## Fourier Transform

26-66

- **Question:** Does (inverse) Fourier transform has derivatives?

**Answer:** If

$$\int_{\mathbb{R}} |x|^n |f(x)| dx < \infty,$$

then Fourier transform has  $k$ th derivatives at  $t = 0$  for all  $k \leq n$ .

**More can be established through the lessen from this section!**
